

# Space Unit

# What Teachers Have Said...

"This resource was perfect. Not only was it engaging for my students and aesthetically pleasing to look at, it also saved me from having to research information and then teach the students - each page of the booklet taught my students about a different aspect of space, and then even formatively assessed their knowledge! I would hands down recommend this resource when learning about outer space with your students."

"This was a nice digital edition to our Space unit. Once the daily lesson was complete, the students used their independent time to complete the slides about the various objects in our solar system. Loved it because it allowed my students to work independently or in a small group. Students loved learning about space.

# Topics Covered

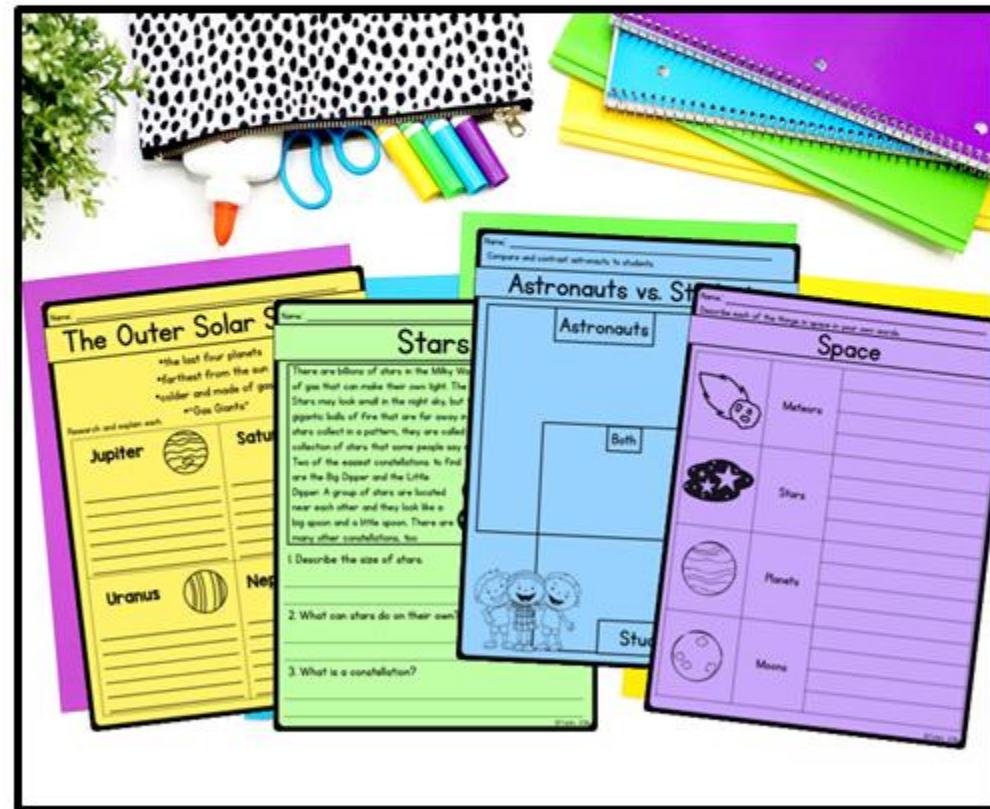

This Space unit is intended to be used as supplemental resources for your science unit.

## Topics Covered:

- Eight Planets
- The Sun
- The Moon
- Astronauts
- Other Space Objects

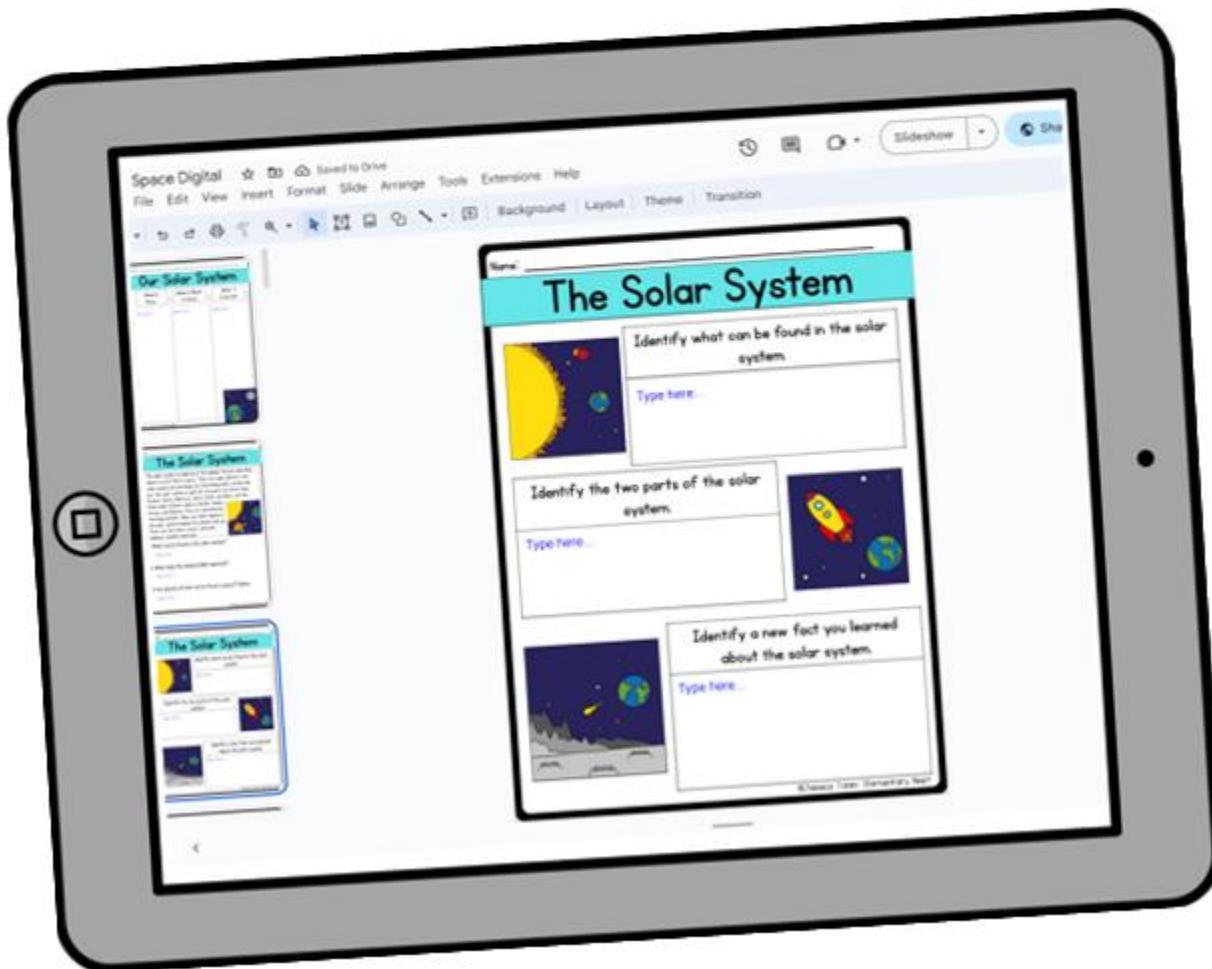

## Types of Resources Included:

- KWL Charts
- Passages
- Comprehension worksheets
- Fact writing worksheets
- Vocabulary worksheets
- Mini books & questions

# Digital Conversion

The passages and worksheets have been digitally converted to Google Slides.

# Inner Planets

Name: \_\_\_\_\_

## Our Solar System

What I Know \_\_\_\_\_  
What I Want to Know \_\_\_\_\_

The solar system is made up of the planets, the sun, and objects around them in space. There are eight planets in the solar system and one large sun. Everything orbits around the sun. The solar system is split into two parts: the Inner Solar System, which is Mercury, Venus, Earth, and Mars, and Outer Solar System, which is Jupiter, Saturn, Uranus, and Neptune. They are separated by the Asteroid Belt. There are other objects in the solar system besides the planets and sun. There are also stars, moons, asteroids, meteors, comets, and more.

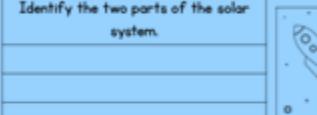

1. What can be found in the solar system?  
\_\_\_\_\_

2. What does the Asteroid Belt separate?  
\_\_\_\_\_

Name: \_\_\_\_\_

## The Solar System

Identify what can be found in the solar system.  

Identify the two parts of the solar system.  

Identify a new fact you learned about the solar system.  

Name: \_\_\_\_\_

## Mercury

When looking at all the planets in a row, Mercury is the smallest planet. It is also part of the Inner Solar System that sits closest to the sun, but that does not mean it is the hottest. Mercury is about 60 million miles from the sun and revolves very slowly. Since it is closest to the sun, the side that faces the sun gets really hot. On the side that faces away from Mercury, it is very cold. Mercury is covered with craters made by asteroids and comets. It also has no water on it, which means that no life can survive on Mercury.

1. Where is Mercury located in the solar system?  
\_\_\_\_\_

Name: \_\_\_\_\_

## Mercury

All About Mercury

Fact #1 \_\_\_\_\_  
Fact #2 \_\_\_\_\_  
Fact #3 \_\_\_\_\_

Name: \_\_\_\_\_

## Venus

Name: \_\_\_\_\_

Venus is the second planet away from the sun. It is the third planet from the sun. It is part of the Inner Solar System. It is the hottest planet in the solar system. It is so bright, it can sometimes be seen in the sky during the day. A year in Venus lasts for 262 days since that is how long it takes to orbit around the sun. Venus is the planet that is closest to the earth.

1. Where can Venus be found in the solar system?  
\_\_\_\_\_

2. Why is it hard to see the surface?  
\_\_\_\_\_

3. How does a year on Venus compare to Earth?  
\_\_\_\_\_

Fact #1 \_\_\_\_\_  
Fact #2 \_\_\_\_\_

Name: \_\_\_\_\_

## Earth

Earth is the third planet from the sun. It is part of the Inner Solar System. Plants and animals can be found on Earth. The temperature is perfect for survival. This is not true for all planets. Earth is the only planet that receives direct sunlight from the sun. It's also the only planet with water on it. Animals and plants can survive. When it is viewed from space, Earth looks like a blue marble. The clouds that collect above it. Earth has one moon that orbits around it. Earth takes 365 days to orbit around the sun and this affects the seasons on Earth. The part of the earth that tilts toward the sun gets warmer summer weather. The part that tilts away from the sun gets colder winter weather.

1. Where can Earth be found in the solar system?  
\_\_\_\_\_

2. What makes Earth different from the other planets?  
\_\_\_\_\_

3. What controls the seasons on Earth?  
\_\_\_\_\_

Fact #1 \_\_\_\_\_  
Fact #2 \_\_\_\_\_

Name: \_\_\_\_\_

## Mars

Mars is the fourth planet from the sun and part of the Inner Solar System. It is called the Red Planet because there are reddish rocks that cover it. The rocks are made of a mineral called iron oxide. Mars is the second largest planet in the solar system. It is similar to Earth. Both planets have polar ice caps, similar day lengths, and also have seasons. Mars is one of the smallest planets in the solar system. There are mountains, craters, and a large basin on Mars. Mars has two moons that orbit around it, named Phobos and Deimos.

1. Where can Mars be found in the solar system?  
\_\_\_\_\_

2. How is Mars similar to the earth?  
\_\_\_\_\_

3. What can be found on Mars?  
\_\_\_\_\_

Fact #1 \_\_\_\_\_  
Fact #2 \_\_\_\_\_  
Fact #3 \_\_\_\_\_

# Outer Planets

**Jupiter**

Jupiter is the fifth planet from the sun. It is part Outer Solar System, which consists of four gas giants. Jupiter is the largest planet in our solar system. Jupiter takes 11 Earth years to orbit the sun than the Earth, but it only takes 9 hours to spin around its axis, compared to Earth's 24 hours. This quick spinning causes storms. Jupiter has a constant storm called the Great Red Spot. It has lasted for over 300 years. Jupiter is so large that it has 64 moons. Much of the planet's surface is made of hydrogen and helium.

- Where can Jupiter be found in the solar system?
- What does Jupiter's quick rotation cause?
- What does Jupiter have a lot of?

**Jupiter**

**All About Jupiter**

Fact #1  
Fact #2

**Saturn**

Saturn is the sixth planet from the sun. It is part of the Outer Solar System, meaning it's one of the gas giants. Saturn is easily identified because of the large rings around it. These rings are made of ice, rocks, and dust. This second largest planet has a ring around it, too. Saturn has 18 moons that rotate around it. Compared to Earth, Saturn takes over 29 years to orbit the sun, but it rotates on an axis quicker than Earth, though. It spins around in 10 hours, which can cause hurricanes and storms. Saturn is made up of mostly hydrogen and helium, making it the least dense and lightest planet in space.

- Where can Saturn be found in the solar system?
- What can be found around Saturn? What is it made of?

**Saturn**

**All About Saturn**

Fact #1  
Fact #2  
Fact #3

**Uranus**

Uranus is the seventh planet from the sun. It is one of the gas giants that is part of the Outer Solar System. Uranus has 27 moons that orbit around it. This planet is the smallest out of the four gas giants, but is still much larger than Earth. Uranus is bluish green color because of the planet being made up of methane and ammonia. The atmosphere around it is made up of hydrogen and helium. Uranus is unique because it has thin rings and spins in a different direction than other planets. This is because the planet appears to be lying on its side.

- Where can Uranus be found in the solar system?
- Explain Uranus' size.
- Explain why Uranus is different from other planets?

**The Inner Solar System**

- \*the first four planets
- \*closest to the sun
- \*warmer
- \*made of rocks

**Mercury**      **Venus**

**The Outer Solar System**

- \*the last four planets
- \*farthest from the sun
- \*colder and made of gas
- \*\*Gas Giants\*\*

<b>Jupiter</b>	<b>Saturn</b>
<b>Earth</b>	<b>Mars</b>
<b>Uranus</b>	<b>Neptune</b>

**Neptune**

Neptune is the eighth and last planet in the solar system. It is the last gas giant found in the Outer System. It has the slowest rotation of all the planets. It has a constant storm called the Great Dark Spot. It takes Neptune 165 Earth days to orbit around the sun. It has a much longer distance than Earth does. However, Neptune has slightly shorter days than Earth. It spins on its axis in only 16 hours, compared to Earth's 24 hour day. Neptune has a large white cloud that rotates around its atmosphere. It is called Scooter because it scoots around the planet.

- Where can Neptune be found in the solar system?
- Can Neptune go around the sun as quickly as Earth?
- Explain Scooter.

**Neptune**

**All About Neptune**

Fact #1  
Fact #2  
Fact #3

# The Sun and the Moon

## What About Pluto?

For a very long while, Pluto was the ninth planet. However, it was recently ruled to no longer consider one of the solar system's planets. The reason that it is no longer considered a planet is its size and orbit. The size of Pluto is much smaller than all of the other planets. Its orbit also follows a different pattern than the other planets. It is now a dwarf planet instead of one of the solar system's main planets. It was changed to a dwarf planet in 2006.

1. What was Pluto considered in the past?  
2. As of 2006, what is Pluto?  
3. Why did this change?

## Pluto

### All About Pluto

Fact #1      Fact #2      Fact #3

## Stars

There are billions of stars in the Milky Way galaxy of gas that can make their own light. The also make stars look small in the night sky, but they are gigantic balls of fire that are far away in space. Stars collect in a pattern; they are called constellations. A collection of stars that some people say make up two of the easiest constellations to find are the Big Dipper and the Little Dipper. A group of stars are located near each other and they look like a big spoon and a little spoon. There are many other constellations, too!

1. Describe the size of stars.  
2. What can stars do on their own?  
3. What is a constellation?

## The Sun

The sun is a large ball of burning gases. It is actually one large star. It is at the center of the solar system. Planets and other bodies orbit in a circle around the sun. The sun is over 90 million miles away from Earth. The heat on the sun is so hot that nothing could ever survive on it. It is about 10,000 degrees Fahrenheit and gets even hotter towards the core. This heat may be dangerous, but it is necessary for the solar system and the earth. On the earth, people get light and heat for survival. The sun also gives the earth its seasons. When the earth orbits the sun, it also rotates. Seasons and weather patterns are due to the orbiting and rotating.

1. What is the sun?  
2. Explain the sun's rotation.  
3. What are the seasons?

## The Moon

There are moons for many planets, but there is only one moon for the earth. This moon is almost always visible at night and sometimes during the day. Our moon is a huge piece of rock that orbits the earth. It is a solid moon with craters, mountains, and valleys. The big difference between Earth and the moon, though, is that there is water on the moon. The earth rotates, or spins around in 24 hours, while the moon rotates in 28 days. The moon orbits around the earth and it usually takes 28 days to do so. As this happens, they both orbit the sun, too. The moon does not give off its own light. We can see the moon because of the sun's light shining on it. There is less gravity on the moon than on earth, so when astronauts go there, they appear to float around.

1. What is the earth's moon made of?  
2. Explain how we are able to see the moon.  
3. How long does the moon take to orbit the earth?

## The Moon

### Draw yourself on the moon.

Explain what you would see and how you would feel on the moon.

## Moon Phases

There are different phases of the moon. Just like the sun, the moon has phases. Sometimes it's full, sometimes it's half, and sometimes it's missing. These are all phases. The moon does not give off its own light. What humans can see of the moon is the reflected light coming from the sun. The amount of moon we can see by the amount of earth that is blocking these sunrays.

The first phase of the moon is the new moon. We cannot see any sunlight reflecting on the new moon. Next is the waxing crescent moon. Waxing means it is appearing bigger. More moon is visible after this, until the quarter moon and the waxing gibbous. The gibbous phase is between quarter and full moon. Finally, we can see the full moon about 14 days after the new moon. Then, it changes back to a waning gibbous, which gets smaller, and a crescent moon.

Describe the moon phases in your own words.

## Moon Phases

last quarter	new moon	waxing gibbous
waxing gibbous	waning crescent	waxing crescent

Name: \_\_\_\_\_  
In one to two sentences explain moon phases.

# Astronauts and Space Objects

Name: _____	
<h1>Astronauts</h1>	
<p>For thousands of years, scientists have studied the moon and space. They have used telescopes, studied stars and planets, and studied moon phases. In the last century, astronauts have expanded these studies by going into space. An astronaut is a person who is trained to go into space on a spacecraft. In 1969, Neil Armstrong was the first astronaut to set foot on the moon. Since then, 11 more people have walked on the moon. Not all astronauts go to space to walk on the moon. Many of them go up for different expeditions, such as studying planets or comets. In the United States, astronauts must be trained by NASA.</p>	
	
1. What is an astronaut?	
<hr/> <hr/>	
2. What did Neil Armstrong do?	
<hr/> <hr/>	
3. How has the study of space changed over the years?	
<hr/> <hr/>	
Name: _____	
Compare and contrast astronauts to students.	

Name: _____
<h1>Meteors, Asteroids, and Comets</h1>
<p>Space is much more than just planets, stars, and the sun. Other things move about space. A few of these are meteors, asteroids, and comets. A meteor is also known as a shooting star. They can get as large as a softball and when they enter Earth's atmosphere, they get hot enough to streak across the sky. A comet is ball of ice, dust, and rocky debris that flies through the sky. They orbit in the solar system much like a planet. An asteroid is similar to a comet in that it is a body of rock and metal. Asteroids appear slightly different, without a glow or tail.</p> 
1. Explain what a comet is.  <hr/> <hr/>
2. How is an asteroid different from a comet?  <hr/> <hr/>
3. What causes a meteor to look like a shooting star?  <hr/> <hr/>
Name: _____

Name: _____	Compare and contrast astronauts to students.
<h1>Astronauts vs. Students</h1>	
<b>Astronauts</b>	
Both	
	
<b>Students</b>	

Name: _____	Describe each of the things in space in your own words.
<b>Space</b>	
	Meteors
	Stars
	Planets
	Moons

# Mini Books

These fold-and-go mini books contain three pages of nonfiction material, followed up with three comprehension questions.
